```

1.2 Merge Sort Tree

Like a segment tree but each node st_i stores a sorted subarray

- $inrange(l, r, a, b)$: counts the number of elements $x \in [l, r]$ such that $a \leq x \leq b$.

Memory: $O(N \log N)$

Build: $O(N \log N)$

$inrange$: $O(\log^2 N)$

```

template <class T>
struct MergeSortTree {
    int n;
    vector<vector<T>> st;
    MergeSortTree(vector<T>& xs) : n(len(xs)), st(n << 1) {
        for (int i = 0; i < n; i++) st[i + n] = vector<T>({xs[i]});

        for (int i = n - 1; i > 0; i--) {
            st[i].resize(len(st[i << 1]) + len(st[i << 1 | 1]));
            merge(all(st[i << 1]), all(st[i << 1 | 1]), st[i].begin());
        }
    }
}

```

```

int count(int i, T a, T b) {
    return upper_bound(all(st[i]), b) - lower_bound(all(st[i]), a);
}

int inrange(int l, int r, T a, T b) {
    int ans = 0;

    for (l += n, r += n + 1; l < r; l >>= 1, r >>= 1) {
        if (l & 1) ans += count(l++, a, b);
        if (r & 1) ans += count(--r, a, b);
    }

    return ans;
}
};

```

1.3 Minimal Excluded With Updates (MEX-U)

In the problem you need to change individual numbers in the array, and compute the new MEX of the array after each such update.

Pre-compute: $O(N \log N)$

Update: $O(\log N)$

Query: $O(1)$

```

class Mex {
private:
    map<ll, ll> frequency;
    set<ll> missing_numbers;
    vl A;

public:
    Mex(vl const& A) : A(A) {
        for (ll i = 0; i <= A.size(); i++) missing_numbers.insert(i);

        for (ll x : A) {
            ++frequency[x];
            missing_numbers.erase(x);
        }
    }

    ll mex() { return *missing_numbers.begin(); }

    void update(ll idx, ll new_value) {
        if (--frequency[A[idx]] == 0) missing_numbers.insert(A[idx]);
        A[idx] = new_value;
        ++frequency[new_value];
        missing_numbers.erase(new_value);
    }
};

```

1.4 Minimal Excluded (MEX)

Given an array A of size N . You have to find the minimal non-negative element that is not present in the array. That number is commonly called the MEX (minimal excluded).

Time: $O(N)$

```

ll mex(vl const& A) {
    static bool used[MAX + 111] = {0};

    for (ll x : A) {
        if (x <= MAX) used[x] = true;
    }

    ll result = 0;
    while (used[result]) ++result;

    for (ll x : A) {
        if (x <= MAX) used[x] = false;
    }

    return result;
}

```

1.5 Segment Tree (Parameterized OP)

Query: $O(\log N)$

Update: $O(\log N)$

```

template <typename T, auto op>
class SegTree {
private:
    T e;
    ll N;
    vector<T> seg;

public:
    SegTree(ll N, T e) : e(e), N(N), seg(N + N, e) {}

    void assign(ll i, T v) {
        i += N;
        seg[i] = v;
        for (i >>= 1; i; i >>= 1) seg[i] = op(seg[2 * i], seg[2 * i + 1]);
    }

    T query(ll l, ll r) {
        T la = e, ra = e;
        l += N;
        r += N;

        while (l <= r) {
            if (l & 1) la = op(la, seg[l++]);
            if (~r & 1) ra = op(seg[r--], ra);
            l >>= 1;
            r >>= 1;
        }

        return op(la, ra);
    }
};

```

1.6 Segment Tree 2D

Query: $O(\log N \cdot \log M)$

Update: $O(\log N \cdot \log M)$

```
template <typename T, auto op>
class SegTree {
private:
    T e;
    ll n, m;
    vector<vector<T>> seg;

public:
    SegTree(ll n, ll m, T e)
        : e(e), n(n), m(m), seg(2 * n, vector<T>(2 * m, e)) {}

    void assign(ll x, ll y, T v) {
        ll ny = y += m;
        for (x += n; x; x >>= 1, y = ny) {
            if (x >= n)
                seg[x][y] = v;
            else
                seg[x][y] = op(seg[2 * x][y], seg[2 * x + 1][y]);

            while (y >>= 1) seg[x][y] = op(seg[x][2 * y], seg[x][2 * y + 1]);
        }
    }

    T query(ll lx, ll rx, ll ly, ll ry) {
        ll ans = e, nx = rx + n, my = ry + m;

        for (lx += n, ly += m; lx <= ly; ++lx >>= 1, --ly >>= 1)
            for (rx = nx, ry = my; rx <= ry; ++rx >>= 1, --ry >>= 1) {
                if (lx & 1 and rx & 1) ans = op(ans, seg[lx][rx]);
                if (lx & 1 and !(ry & 1)) ans = op(ans, seg[lx][ry]);
                if (!(ly & 1) and rx & 1) ans = op(ans, seg[ly][rx]);
                if (!(ly & 1) and !(ry & 1)) ans = op(ans, seg[ly][ry]);
            }

        return ans;
    }
};
```

1.7 Union Find Disjoint Set (UFDS)

Uncomment the lines to recover which element belong to each set.

Time: $\approx O(1)$ for everything.

```
class UFDS {
public:
    vi ps, size;
    // vector<unordered_set<int>> sts;

    UFDS(int N) : size(N + 1, 1), ps(N + 1), sts(N) {
        iota(ps.begin(), ps.end(), 0);
        // for (int i = 0; i < N; i++) sts[i].insert(i);
    }

    int find_set(int x) { return x == ps[x] ? x : (ps[x] = find_set(ps[x])); }

    bool same_set(int x, int y) { return find_set(x) == find_set(y); }
```

```
void union_set(int x, int y) {
    if (same_set(x, y)) return;

    int px = find_set(x);
    int py = find_set(y);

    if (size[px] < size[py]) swap(px, py);

    ps[py] = px;
    size[px] += size[py];
    // sts[px].merge(sts[py]);
}
};
```

1.8 Wavelet Tree

Build: $O(N \cdot \log \sigma)$.

Queries: $O(\log \sigma)$.

σ = alphabet length

```
typedef vector<int>::iterator iter;

class WaveletTree {
public:
    int L, H;
    WaveletTree *l, *r;
    vector<int> frq;

    WaveletTree(iter fr, iter to, int x, int y) {
        L = x, H = y;
        if (fr >= to) return;

        int M = L + ((H - L) >> 1);
        auto F = [M](int x) { return x <= M; };

        frq.reserve(to - fr + 1);
        frq.push_back(0);
        for (auto it = fr; it != to; it++) frq.push_back(frq.back() + F(*it));

        if (H == L) return;
        auto pv = stable_partition(fr, to, F);
        l = new WaveletTree(fr, pv, L, M);
        r = new WaveletTree(pv, to, M + 1, H);
    }

    // Find the k-th smallest element in positions [i,j].
    // TO BE IMPLEMENTED
    int quantile(int k, int i, int j) const { return 0; }

    // Count occurrences of number c until position i -> [0, i].
    int rank(int c, int i) { return until(c, min(i + 1, (int)frq.size() - 1)); }

    int until(int c, int i) {
        if (c > H or c < L) return 0;
        if (L == H) return i;

        int M = L + ((H - L) >> 1);
```

```

int r = frq[i];
if (c <= M)
    return this->l->until(c, r);
else
    return this->r->until(c, i - r);
}

// Count number of occurrences of numbers in the range [a, b]
int range(int i, int j, int a, int b) const {
    if (b < a or j < i) return 0;
    return range(i, j + 1, L, H, a, b);
}

int range(int i, int j, int a, int b, int L, int U) const {
    if (b < L or U < a) return 0;
    if (L <= a and b <= U) return j - i;
    int M = a + ((b - a) >> 1);
    int ri = frq[i], rj = frq[j];
    return this->l->range(ri, rj, a, M, L, U) +
           this->r->range(i - ri, j - rj, M + 1, b, L, U);
}
};

```

2 Dynamic programming

2.1 Kadane

```

int kadane(const vi& xs) {
    vi s(xs.size());
    s[0] = xs[0];

    for (size_t i = 1; i < xs.size(); ++i) s[i] = max(xs[i], s[i - 1] + xs[i]);

    return *max_element(all(s));
}

```

2.2 Longest Increasing Subsequence (LIS)

Time: $O(N \cdot \log N)$.

```

int lis(vi const& a) {
    int n = a.size();
    const int INF = 1e9;
    vi d(n + 1, INF);
    d[0] = -INF;

    for (int i = 0; i < n; i++) {
        int l = upper_bound(d.begin(), d.end(), a[i]) - d.begin();
        if (d[l - 1] < a[i] && a[i] < d[l]) d[l] = a[i];
    }

    int ans = 0;
    for (int l = 0; l <= n; l++) {
        if (d[l] < INF) ans = l;
    }

    return ans;
}

```

```

}

```

3 Extras

3.1 cin/cout __int128_t

Allows standard reading and writing with cin/cout for 128-bit integers using `__int128_t` type.

```

ostream& operator<<(ostream& dest, __int128_t value) {
    ostream::sentry s(dest);
    if (s) {
        __uint128_t tmp = value < 0 ? -value : value;
        char buffer[128];

4 Geometry

4.1 Convex Hull

Given a set of points find the smallest convex polygon that contains all the given points.

Time: $O(N \cdot \log N)$

By default it removes the collinear points, set the boolean to true if you don't want that

```

struct pt {
    double x, y;
};

```

```

int orientation(pt a, pt b, pt c) {
    double v = a.x * (b.y - c.y) + b.x * (c.y - a.y) + c.x * (a.y - b.y);
    if (v < 0) return -1; // clockwise
    if (v > 0) return +1; // counter-clockwise
    return 0;
}

bool cw(pt a, pt b, pt c, bool include_collinear) {
    int o = orientation(a, b, c);
    return o < 0 || (include_collinear && o == 0);
}

bool collinear(pt a, pt b, pt c) { return orientation(a, b, c) == 0; }

void convex_hull(vector<pt>& a, bool include_collinear = false) {
    pt p0 = *min_element(a.begin(), a.end(), [](pt a, pt b) {
        return make_pair(a.y, a.x) < make_pair(b.y, b.x);
    });
    sort(a.begin(), a.end(), [&p0](const pt& a, const pt& b) {
        int o = orientation(p0, a, b);
        if (o == 0)
            return (p0.x - a.x) * (p0.x - a.x) + (p0.y - a.y) * (p0.y - a.y) <
                (p0.x - b.x) * (p0.x - b.x) + (p0.y - b.y) * (p0.y - b.y);
        return o < 0;
    });
    if (include_collinear) {
        int i = (int)a.size() - 1;
        while (i >= 0 && collinear(p0, a[i], a.back())) i--;
        reverse(a.begin() + i + 1, a.end());
    }

6.3 Count Divisors

```

ll count_divisors(ll num) {
    ll count = 1;
    for (int i = 2; (ll)i * i <= num; i++) {
        if (num % i == 0) {
            int e = 0;
            do {
                e++;
                num /= i;
            } while (num % i == 0);
            count *= e + 1;
        }
    }
    if (num > 1) {
        count *= 2;
    }
    return count;
}

```

6.4 Factorization With Sieve

```

map<ll, ll> factorization_with_sieve(ll n, const vl& primes) {
    map<ll, ll> fact;

    for (ll d : primes) {
        if (d * d > n) break;

        ll k = 0;
        while (n % d == 0) {
            k++;
            n /= d;
        }

        if (k) fact[d] = k;
    }

    if (n > 1) fact[n] = 1;
    return fact;
}

```

6.5 Factorization

```

map<ll, ll> factorization(ll n) {
    map<ll, ll> ans;
    for (ll i = 2; i * i <= n; i++) {
        ll count = 0;
        for (; n % i == 0; count++, n /= i)

```

```

    ;
    if (count) ans[i] = count;
}
if (n > 1) ans[n]++;
return ans;
}

```

6.6 Fast Doubling - Fibonacci

The Doubling Method can be seen as an improvement to the matrix exponentiation method to find the N -th Fibonacci number.

Time: $O(\log N)$.

```

template <typename T>
class FastDoubling {
public:
    vector<T> sts;
    T a, b, c, d;
    int mod;

    FastDoubling(int mod = 1e9 + 7) : sts(2), mod(mod) {}

    T fib(T x) {
        fill(all(sts), 0);
        a = 0, b = 0, c = 0, d = 0;
        fast_doubling(x, sts);
        return sts[0];
    }

    void fast_doubling(T n, vector<T>& res) {
        if (n == 0) {
            res[0] = 0;
            res[1] = 1;
            return;
        }
        fast_doubling(n >> 1, res);

        a = res[0];
        b = res[1];
        c = (b << 1) - a;

        if (c < 0) c += mod;

        c = (a * c) % mod;
        d = (a * a + b * b) % mod;
        if (n & 1) {
            res[0] = d;
            res[1] = c + d;
        } else {
            res[0] = c;
            res[1] = d;
        }
    }
};

```

6.7 Fast Exp Iterative

```

ll fast_exp_it(ll a, ll n, ll mod = LLONG_MAX) {
    a %= mod;
    ll res = 1;

    while (n) {
        if (n & 1) (res *= a) %= mod;

        (a *= a) %= mod;
        n >>= 1;
    }

    return res;
}

```

6.8 Fast Exp

```

ll fast_exp(ll a, ll n, ll mod = LLONG_MAX) {
    if (n == 0) return 1;
    if (n == 1) return a;

    ll x = fast_exp(a, n / 2, mod) % mod;

    return ((x * x) % mod * (n & 1 ? a : 1)) % mod;
}

```

6.9 Fast Fourier Transform (FFT)

Time: $O(N \cdot \log N)$

```

using cd = complex<double>;
const double PI = acos(-1);

void fft(vector<cd>& a, bool invert) {
    int n = a.size();

    for (int i = 1, j = 0; i < n; i++) {
        int bit = n >> 1;
        for (; j & bit; bit >>= 1) j ^= bit;
        j ^= bit;

        if (i < j) swap(a[i], a[j]);
    }

    for (int len = 2; len <= n; len <= 1) {
        double ang = 2 * PI / len * (invert ? -1 : 1);
        cd wlen(cos(ang), sin(ang));
        for (int i = 0; i < n; i += len) {
            cd w(1);
            for (int j = 0; j < len / 2; j++) {
                cd u = a[i + j], v = a[i + j + len / 2] * w;
                a[i + j] = u + v;
                a[i + j + len / 2] = u - v;
                w *= wlen;
            }
        }
    }

    if (invert) {
        for (cd& x : a) x /= n;
    }
}

```

```

}
}

void fft_2d(vector<vector<cd>>& V, bool invert) {
    for (int i = 0; i < V.size(); i++) fft(V[i], invert);
    for (int i = 0; i < V.front().size(); i++) {
        vector<cd> col(V.size());
        for (int k = 0; k < V.size(); k++) col[k] = V[k][i];
        fft(col, invert);
        for (int k = 0; k < V.size(); k++) V[k][i] = col[k];
    }
}

```

6.10 GCD

The Euclidean algorithm allows to find the greatest common divisor of two numbers a and b in $O(\log \cdot \min(a, b))$.

```

ll gcd(ll a, ll b) { return b ? gcd(b, a % b) : a; }

```

6.11 Integer Mod

```

const ll INF = 1e18;
const ll mod = 998244353;
template <ll MOD = mod>

        return this->value = (this->value - 1 + MOD) % MOD;
    }

    Modular operator--() { return this->value = (this->value - 1 + MOD) % MOD; }
    friend Modular operator*(Modular a, Modular const b) { return a *= b; }
    friend Modular operator/(Modular a, Modular const b) { return a /= b; }
    friend std::ostream& operator<<(std::ostream& os, Modular const& a) {
        return os << a.value;
    }

    friend bool operator==(Modular const& a, Modular const& b) {
        return a.value == b.value;
    }

    friend bool operator!=(Modular const& a, Modular const& b) {
        return a.value != b.value;
    }
};

```

6.12 Is prime

$O(\sqrt{N})$

```

bool isprime(ll n) {
    if (n < 2) return false;
    if (n == 2) return true;
    if (n % 2 == 0) return false;
    for (ll i = 3; i * i <= n; i += 2)
        if (n % i == 0) return false;
    return true;
}

```

6.13 LCM

Calculating the least common multiple (commonly denoted LCM) can be reduced to calculating the GCD with the following simple formula: $\text{lcm}(a, b) = (a \cdot b) / \text{gcd}(a, b)$. Thus, LCM can be calculated using the Euclidean algorithm with the same time complexity:

```

ll lcm(ll a, ll b) { return a / gcd(a, b) * b; }

```

6.14 Euler phi $\varphi(n)$

Computes the number of positive integers less than n that are co-primes with n , in $O(\sqrt{N})$.

```

11 phi(11 n) {
    if (n == 1) return 1;

    auto fs = factorization(n);
    auto res = n;

    for (auto [p, k] : fs) {
        res /= p;
        res *= (p - 1);
    }

    return res;
}

```

6.15 Sieve

```

v1 sieve(11 N) {
    bitset<MAX + 1> sieve;
    v1 ps{2, 3};
    sieve.set();

    for (11 i = 5, step = 2; i <= N; i += step, step = 6 - step) {
        if (sieve[i]) {
            ps.push_back(i);

            for (11 j = i * i; j <= N; j += 2 * i) sieve[j] = false;
        }
    }
    return ps;
}

```

6.16 Sum Divisors

```

11 sum_divisors(11 num) {
    11 result = 1;

    for (int i = 2; (11)i * i <= num; i++) {
        if (num % i == 0) {
            int e = 0;
            do {
                e++;
                num /= i;
            } while (num % i == 0);

            11 sum = 0, pow = 1;
            do {
                sum += pow;
                pow *= i;
            } while (e-- > 0);
            result *= sum;
        }
    }
    if (num > 1) {
        result *= (1 + num);
    }
    return result;
}

```

6.17 Sum of difference

Function to calculate sum of absolute difference of all pairs in array: $\frac{1}{2} \sum_{i=1}^N \sum_{j=1}^N |A_i - A_j|$

```

11 sum_of_difference(v1& arr, 11 n) {
    sort(all(arr));

    11 sum = 0;
    for (11 i = 0; i < n; i++) {
        sum += i * arr[i] - (n - 1 - i) * arr[i];
    }

    return sum;
}

```

7 Problems

7.1 Kth Digit String (CSES)

Time: $O(\log_{10} K)$.

Space: $O(1)$.

```

11 kth_digit_string(11 k) {

```

8 Strings

8.1 Aho-Corasick

The Aho-Corasick algorithm allows us to quickly search for multiple patterns in a text. The set of pattern strings is also called a *dictionary*. We will denote the total length of its constituent strings by m and the size of the alphabet by k .

build: $O(m \cdot k)$
occurrences: $O(|s| + ans)$

```

const int K = 26;
struct Vertex {
    char pch;
    int next[K];
    bool check = false;
    int p = -1, lnk = -1, out = -1, ps = -1, d = 0;

    Vertex(int p = -1, char ch = '$') : p(p), pch(ch) {
        fill(begin(next), end(next), -1);
    }
};

class AhoCorasick {
public:
    int sz = 0; // number of strings added
    vector<Vertex> t;

    AhoCorasick() : t(1) {}

    void add_string(string const& s) {
        int v = 0, ds = 0;
        for (char ch : s) {
            int c = ch - 'a';
            if (t[v].next[c] == -1) {

```

```

        t[v].next[c] = t.size();
        t.emplace_back(v, ch);
    }
    v = t[v].next[c];
    t[v].d = ++ds;
}
t[v].check = true;
t[v].ps = sz++;
}

void build() {
    queue<int> qs;
    qs.push(0);
    while (qs.size()) {
        auto u = qs.front();
        qs.pop();

        if (!t[u].p or t[u].p == -1)

        while (t[k].out != -1) {
            k = t[k].out;
            res[t[k].ps].emplace_back(i - t[k].d + 1);
        }
        if (t[v].check) res[t[v].ps].emplace_back(i - t[v].d + 1);
    }
}

```

```

    }
}
};

```

8.2 Edit Distance

Returns the minimum number of operations (insert, delete, replace) to transform string a into string b .
Time: $O(M * N)$

```

int min_value(int x, int y, int z) { return min(min(x, y), z); }

int edit_distance(string str1, string str2) {
    int n = (int)str1.size(), m = (int)str2.size();
    int dp[m + 1][n + 1];

    for (int i = 0; i <= m; i++)
        for (int j = 0; j <= n; j++)
            if (i == 0)
                dp[i][j] = j;
            else if (j == 0)
                dp[i][j] = i;
            else if (str1[i - 1] == str2[j - 1])
                dp[i][j] = dp[i - 1][j - 1];
            else
                dp[i][j] = 1 + min_value(dp[i][j - 1], dp[i - 1][j], dp[i - 1][j - 1]);

    return dp[m][n];
}

```

8.3 LCP with Suffix Array

For a given string s we want to compute the longest common prefix (LCP) of two arbitrary suffixes with position i and j . In fact, let the request be to compute the LCP of the suffixes $p[i]$ and $p[j]$. Then the answer to this query will be $\min(lcp[i], lcp[i + 1], \dots, lcp[j - 1])$. Thus the problem is reduced to the RMQ.
Time: $O(N)$.

```

vector<int> lcp_suffix_array(string const& s, vector<int> const& p) {
    int n = s.size();
    vector<int> rank(n, 0);
    for (int i = 0; i < n; i++) rank[p[i]] = i;

    int k = 0;
    vector<int> lcp(n - 1, 0);
    for (int i = 0; i < n; i++) {
        if (rank[i] == n - 1) {
            k = 0;
            continue;

    T query(ll l, ll r) {
        if (r - l + 1 <= b) return small(r, r - l + 1);
        ll ans = op(small(l + b - 1), small(r));
        ll x = l / b + 1, y = r / b - 1;
        if (x <= y) {
            ll j = msb(y - x + 1);
            ans = op(ans, op(t[n / b * j + x], t[n / b * j + y - (1 << j) + 1]));
        }
        return ans;
    }
};

struct LCA {
    SparseTable<ll> st;
    ll n;
    vl v, pos, dep;

    LCA(const vl2d& g, ll root) : n(len(g)), pos(n) {
        dfs(root, 0, -1, g);
        st = SparseTable<ll>(vector<ll>(all(dep)));
    }

    void dfs(ll i, ll d, ll p, const vl2d& g) {

```

```

        v.emplace_back(len(dep)) = i, pos[i] = len(dep), dep.emplace_back(d);
        for (auto j : g[i])
            if (j != p) {
                dfs(j, d + 1, i, g);
                v.emplace_back(len(dep)) = i, dep.emplace_back(d);
            }
    }

    ll lca(ll a, ll b) {
        ll l = min(pos[a], pos[b]);
        ll r = max(pos[a], pos[b]);
        return v[st.query(l, r)];
    }
    ll dist(ll a, ll b) {
        return dep[pos[a]] + dep[pos[b]] - 2 * dep[pos[lca(a, b)]];
    }
};

```

9.4 Tree Flatten

```

vll tree_flatten(ll root) {
    vl pre;
    pre.reserve(N);

    vll flat(N);
    ll timer = -1;
    auto dfs = [&](auto&& self, ll u, ll p) -> void {
        timer++;
        pre.push_back(u);
        for (auto [v, w] : adj[u])
            if (v != p) {
                self(self, v, u);
            }
        flat[u].second = timer;
    };
    dfs(dfs, root, -1);
    for (ll i = 0; i < (ll)N; i++) flat[pre[i]].first = i;
    return flat;
}

```

9.5 Tree Isomorph

Checks whether two trees are isomorphic. The function *thash()* returns the hash of the tree (using centroids as special vertices). Two trees are isomorphic if their hash are the same.

```

map<vector<int>, int> mhash;

struct tree {
    int n;
    vector<vector<int>> g;
    vector<int> sz, cs;

    tree(int n_) : n(n_), g(n_), sz(n_) {}

    void dfs_centroid(int v, int p) {
        sz[v] = 1;
        bool cent = true;

```

```

for (int u : g[v])
    if (u != p) {
        dfs_centroid(u, v), sz[v] += sz[u];
        if (sz[u] > n / 2) cent = false;
    }
if (cent and n - sz[v] <= n / 2) cs.push_back(v);
}
int fhash(int v, int p) {
    vector<int> h;
    for (int u : g[v])
        if (u != p) h.push_back(fhash(u, v));
    sort(h.begin(), h.end());
    if (!mphash.count(h)) mphash[h] = mphash.size();
    return mphash[h];
}
ll thash() {
    cs.clear();
    dfs_centroid(0, -1);
    if (cs.size() == 1) return fhash(cs[0], -1);
    ll h1 = fhash(cs[0], cs[1]), h2 = fhash(cs[1], cs[0]);
    return (min(h1, h2) << 30) + max(h1, h2);
}
void add(int a, int b) {
    g[a].emplace_back(b);
    g[b].emplace_back(a);
}
};

```

10 Settings and macros

10.1 short-macro.cpp

```

#include <bits/stdc++.h>

using namespace std;

#ifdef DEBUG
#include "../settings-and-macros/debug.cpp"
#else
#define dbg(...)
#endif

typedef long long ll;
typedef pair<int, int> ii;

#define all(x) x.begin(), x.end()
#define vin(vt) for (auto &e : vt) cin >> e

auto solve() { }

int main() {
    ios_base::sync_with_stdio(0);
    cin.tie(0);

    ll t = 1;
    //cin >> t;
}

```

```

while (t--) solve();

return 0;
}

```

10.2 macro.cpp

```

#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>

using namespace __gnu_pbds;
#define ordered_set tree<int, null_type, less<int>, rb_tree_tag,
    tree_order_statistics_node_update>

using namespace std;

#ifdef DEBUG
#include "../settings-and-macros/debug.cpp"
#else
#define dbg(...)
#endif

typedef long long ll;
typedef pair<int, int> pii;
typedef pair<ll, ll> pll;
typedef vector<int> vi;
typedef vector<ll> vl;
typedef vector<pii> vii;
typedef vector<pll> vll;

#define fst first
#define snd second
#define all(x) x.begin(), x.end()
#define len(vt) (int)vt.size()
#define vin(vt) for (auto &e : vt) cin >> e
#define LSONe(S) ((S) & ~(S))
#define MSONe(S) (1ull << (63 - __builtin_clzll(S)))
#define fastio ios_base::sync_with_stdio(0); \
    cin.tie(0); \
    cout.tie(0)

const vii dir4 {{1,0},{-1,0},{0,1},{0,-1}};

auto solve() { }

int main() {
    fastio;

    ll t = 1;
    //cin >> t;

    while (t--) solve();

    return 0;
}

```

11 Theoretical guide

11.1 String Matching with FFT

We are given two strings, a text T and a pattern P , consisting of lowercase letters. We have to compute all the occurrences of the pattern in the text.

We create a polynomial for each string ($T[i]$ and $P[i]$ are numbers between 0 and 25 corresponding to the 26 letters of the alphabet):

$$A(x) = a_0x^0 + a_1x^1 + \dots + a_{n-1}x^{n-1}, \quad n = |T|$$

with

$$a_i = \cos(\alpha_i) + i \sin(\alpha_i), \quad \alpha_i = \frac{2\pi T[i]}{26}$$

And

$$B(x) = b_0x^0 + b_1x^1 + \dots + b_{m-1}x^{m-1}, \quad m = |P|$$

with

$$b_i = \cos(\beta_i) - i \sin(\beta_i), \quad \beta_i = \frac{2\pi P[m-i-1]}{26}$$

Notice that with the expression $P[m-i-1]$ explicitly reverses the pattern.

The $(m-1+i)$ th coefficients of the product of the two polynomials $C(x) = A(x) \cdot B(x)$ will tell us, if the pattern appears in the text at position i .

If there isn't a match, then at least a character is different, which leads that one of the products

$a_{i+1} \cdot b_{m-1-j}$ is not equal to 1, which leads to the coefficient $c_{m-1+i} \neq m$.

11.1.1 Wildcards

This is an extension of the previous problem. This time we allow that the pattern contains the wildcard character $*$, which can match every possible letter.

We create the exact same polynomials, except that we set $b_i = 0$ if $P[m-i-1] = *$. If x is the number of wildcards in P , then we will have a match of P in T at index i if $c_{m-1+i} = m - x$.

11.2 Modular Multiplicative Inverse

A modular multiplicative inverse of an integer a is an integer x such that $a \cdot x$ is congruent to 1 modular some modulus m . To write it in a formal way:

$$a \cdot x \equiv 1 \pmod{m}.$$

Euler's theorem, which states that the following congruence is true if a and m are co-primes:

$$a^{\phi(m)} \equiv 1 \pmod{m}$$

Multiply both sides of the above equations by a^{-1} , and we get:

- For an arbitrary (but coprime) modulus m : $a^{\phi(m)-1} \equiv a^{-1} \pmod{m}$
- For a prime modulus m : $a^{m-2} \equiv a^{-1} \pmod{m}$

From these results, we can easily find the modular inverse using the binary exponentiation algorithm, which works in $O(\log m)$ time.

11.3 Exponent With Module

If a and m are coprime, then

$$a^n \equiv a^{n \pmod{\phi(m)}} \pmod{m}$$

Generally, if $n \geq \log_2 m$, then

$$a^n \equiv a^{\phi(m) + [n \pmod{\phi(m)}]} \pmod{m}$$

11.4 Notable Series

1. Sum of the first n naturals:

$$S_n = \sum_{i=1}^n i = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

2. Sum of the squares of the first n naturals:

$$S_n = \sum_{i=1}^n i^2 = 1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

3. Sum of the cubes of the first natural n :

$$S_n = \sum_{i=1}^n i^3 = 1^3 + 2^3 + 3^3 + \dots + n^3 = \left[\frac{n(n+1)}{2} \right]^2$$

4. Sum of the first n odd numbers:

$$S_n = \sum_{i=1}^n 2i - 1 = 1 + 3 + 5 + \dots + (2n - 1) = n^2$$

11.5 Number of Different Substrings

$$\sum_{i=0}^{n-1} (n - p[i]) - \sum_{i=0}^{n-2} \text{lcp}[i] = \frac{n^2 + n}{2} - \sum_{i=0}^{n-2} \text{lcp}[i]$$
