```

## 1.2 Merge Sort Tree

Like a segment tree but each node  $st_i$  stores a sorted subarray

- $inrange(l, r, a, b)$  : counts the number of elements  $x \in [l, r]$  such that  $a \leq x \leq b$ .

Memory:  $O(N \log N)$

Build:  $O(N \log N)$

$inrange$ :  $O(\log^2 N)$

```

template <class T>
struct MergeSortTree {
    int n;
    vector<vector<T>> st;
    MergeSortTree(vector<T>& xs) : n(len(xs)), st(n << 1) {
        for (int i = 0; i < n; i++) st[i + n] = vector<T>({xs[i]});

        for (int i = n - 1; i > 0; i--) {
            st[i].resize(len(st[i << 1]) + len(st[i << 1 | 1]));
            merge(all(st[i << 1]), all(st[i << 1 | 1]), st[i].begin());
        }
    }
}

```

```

int count(int i, T a, T b) {
    return upper_bound(all(st[i]), b) - lower_bound(all(st[i]), a);
}

int inrange(int l, int r, T a, T b) {
    int ans = 0;

    for (l += n, r += n + 1; l < r; l >>= 1, r >>= 1) {
        if (l & 1) ans += count(l++, a, b);
        if (r & 1) ans += count(--r, a, b);
    }

    return ans;
}
};

```

### 1.3 Minimal Excluded With Updates (MEX-U)

In the problem you need to change individual numbers in the array, and compute the new MEX of the array after each such update.

Pre-compute:  $O(N \log N)$

Update:  $O(\log N)$

Query:  $O(1)$

```

class Mex {
private:
    map<ll, ll> frequency;
    set<ll> missing_numbers;
    vl A;

public:
    Mex(vl const& A) : A(A) {
        for (ll i = 0; i <= A.size(); i++) missing_numbers.insert(i);

        for (ll x : A) {
            ++frequency[x];
            missing_numbers.erase(x);
        }

        ll mex() { return *missing_numbers.begin(); }

        void update(ll idx, ll new_value) {
            if (--frequency[A[idx]] == 0) missing_numbers.insert(A[idx]);
            A[idx] = new_value;
            ++frequency[new_value];
            missing_numbers.erase(new_value);
        }
    };
};

```

### 1.4 Minimal Excluded (MEX)

Given an array  $A$  of size  $N$ . You have to find the minimal non-negative element that is not present in the array. That number is commonly called the MEX (minimal excluded).

Time:  $O(N)$

```

ll mex(vl const& A) {
    static bool used[MAX + 111] = {0};

    for (ll x : A) {
        if (x <= MAX) used[x] = true;
    }

    ll result = 0;
    while (used[result]) ++result;

    for (ll x : A) {
        if (x <= MAX) used[x] = false;
    }

    return result;
}

```

### 1.5 Range Min Query (RMQ)

Build:  $O(N)$

Query:  $O(1)$

```

// @brunomaletta
template <typename T>
struct rmq {
    vector<T> v;
    int n;
    static const int b = 30;
    vector<int> mask, t;

    int op(int x, int y) { return v[x] <= v[y] ? x : y; }
    int msb(int x) { return __builtin_clz(1) - __builtin_clz(x); }
    int small(int r, int sz = b) { return r - msb(mask[r] & ((1 << sz) - 1)); }
    rmq() {}
    rmq(const vector<T>& v_) : v(v_), n(v.size()), mask(n), t(n) {
        for (int i = 0, at = 0; i < n; mask[i++] = at |= 1) {
            at = (at << 1) & ((1 << b) - 1);
            while (at and op(i - msb(at & -at), i) == i) at ^= at & -at;
        }
        for (int i = 0; i < n / b; i++) t[i] = small(b * i + b - 1);

```

## 1.9 Union Find Disjoint Set (UFDS)

Uncomment the lines to recover which element belong to each set.

Time:  $\approx O(1)$  for everything.

```

class UFDS {
public:
    vi ps, size;
    // vector<unordered_set<int>> sts;

    UFDS(int N) : size(N + 1, 1), ps(N + 1), sts(N) {
        iota(ps.begin(), ps.end(), 0);
        // for (int i = 0; i < N; i++) sts[i].insert(i);
    }

    int find_set(int x) { return x == ps[x] ? x : (ps[x] = find_set(ps[x])); }

    bool same_set(int x, int y) { return find_set(x) == find_set(y); }

    void union_set(int x, int y) {
        if (same_set(x, y)) return;

        int px = find_set(x);
        int py = find_set(y);

        if (size[px] < size[py]) swap(px, py);

        ps[py] = px;
        size[px] += size[py];
        // sts[px].merge(sts[py]);
    }
};

```

## 1.10 Wavelet Tree

Build:  $O(N \cdot \log \sigma)$ .

Queries:  $O(\log \sigma)$ .

$\sigma$  = alphabet length

```

typedef vector<int>::iterator iter;

class WaveletTree {
public:
    int L, H;
    WaveletTree *l, *r;
    vector<int> frq;

}
};

```

## 2 Dynamic programming

### 2.1 Kadane

```

int kadane(const vi& xs) {
    vi s(xs.size());
    s[0] = xs[0];

    for (size_t i = 1; i < xs.size(); ++i) s[i] = max(xs[i], s[i - 1] + xs[i]);

    return *max_element(all(s));
}

```

### 2.2 Longest Increasing Subsequence (LIS)

Time:  $O(N \cdot \log N)$ .

```

int lis(vi const& a) {
    int n = a.size();
    const int INF = 1e9;
    vi d(n + 1, INF);
    d[0] = -INF;

    for (int i = 0; i < n; i++) {
        int l = upper_bound(d.begin(), d.end(), a[i]) - d.begin();
        if (d[l - 1] < a[i] && a[i] < d[l]) d[l] = a[i];
    }

    int ans = 0;
    for (int l = 0; l <= n; l++) {
        if (d[l] < INF) ans = l;
    }

    return ans;
}

```

## 3 Extras

### 3.1 cin/cout \_\_int128\_t

Allows standard reading and writing with cin/cout for 128-bit integers using `__int128_t` type.

```

ostream& operator<<(ostream& dest, __int128_t value) {
    ostream::sentry s(dest);
    if (s) {
        __uint128_t tmp = value < 0 ? -value : value;
        char buffer[128];
        char* d = end(buffer);
        do {
            --d;
            *d = "0123456789"[tmp % 10];
            tmp /= 10;
        } while (tmp != 0);
        if (value < 0) {
            --d;
            *d = '-';
        }
        int len = end(buffer) - d;
        if (dest.rdbuf()->sputn(d, len) != len) dest.setstate(ios_base::badbit);
    }
    return dest;
}

istream& operator>>(istream& is, __int128_t& value) {
    string s;
    is >> s;

    __int128_t res = 0;
    size_t i = 0;

    bool neg = false;
    if (s[i] == '-') neg = 1, i++;
    for (; i < s.size(); ++i) (res *= 10) += (s[i] - '0');

    value = neg ? -res : res;
    return is;
}

```

## 4 Geometry

### 4.1 Convex Hull

Given a set of points find the smallest convex polygon that contains all the given points.

Time:  $O(N \cdot \log N)$

By default it removes the collinear points, set the boolean to true if you don't want that

```

struct pt {
    double x, y;
};

int orientation(pt a, pt b, pt c) {
    double v = a.x * (b.y - c.y) + b.x * (c.y - a.y) + c.x * (a.y - b.y);
    if (v < 0) return -1; // clockwise
}

```

```

    if (v > 0) return +1; // counter-clockwise
    return 0;
}

bool cw(pt a, pt b, pt c, bool include_collinear) {
    int o = orientation(a, b, c);
    return o < 0 || (include_collinear && o == 0);
}

bool collinear(pt a, pt b, pt c) { return orientation(a, b, c) == 0; }

void convex_hull(vector<pt>& a, bool include_collinear = false) {
    pt p0 = *min_element(a.begin(), a.end(), [](pt a, pt b) {
        return make_pair(a.y, a.x) < make_pair(b.y, b.x);
    });
    sort(a.begin(), a.end(), [&p0](const pt& a, const pt& b) {
        int o = orientation(p0, a, b);
        if (o == 0)
            return (p0.x - a.x) * (p0.x - a.x) + (p0.y - a.y) * (p0.y - a.y) <
                (p0.x - b.x) * (p0.x - b.x) + (p0.y - b.y) * (p0.y - b.y);
        return o < 0;
    });
    if (include_collinear) {
        int i = (int)a.size() - 1;
        while (i >= 0 && collinear(p0, a[i], a.back())) i--;
        reverse(a.begin() + i + 1, a.end());
    }

    vector<pt> st;
    for (int i = 0; i < (int)a.size(); i++) {
        while (st.size() > 1 &&
            !cw(st[st.size() - 2], st.back(), a[i], include_collinear))
            st.pop_back();
        st.push_back(a[i]);
    }

    a = st;
}

```

## 4.2 Point To Segment

```

typedef pair<double, double> pdb;

double pt2segment(pdb A, pdb B, pdb E) {
    pdb AB = {B.fst - A.fst, B.snd - A.snd};
    pdb BE = {E.fst - B.fst, E.snd - B.snd};
    pdb AE = {E.fst - A.fst, E.snd - A.snd};

    double AB_BE = AB.fst * BE.fst + AB.snd * BE.snd;
    double AB_AE = AB.fst * AE.fst + AB.snd * AE.snd;

    double ans;
    if (AB_BE > 0) {
        double y = E.snd - B.snd;
        double x = E.fst - B.fst;
        ans = hypot(x, y);
    } else if (AB_AE < 0) {
        double y = E.snd - A.snd;

```

```

        double x = E.fst - A.fst;
        ans = hypot(x, y);
    } else {
        auto [x1, y1] = AB;
        auto [x2, y2] = AE;
        double mod = hypot(x1, y1);
        ans = abs(x1 * y2 - y1 * x2) / mod;
    }

    return ans;
}

```

## 4.3 Polynominoes

Geometric figure made by equal squares, connected between themselves in a way that at least one side of each square coincide with a side of another square.

Watch out: the number of polynominoes increases fastly (size 12 has 63.600 figures)

```

// We consider the rotations
// as distinct (0, 10, 10+9, 10+9+8...)
vi pos = {0, 10, 19, 27, 34, 40, 45, 49, 52, 54, 55};

```

```

const int MAXP = 10;

struct Poly {
    ii v[MAXP];
    int64_t id;
    int n;

    Poly() {
        n = 1;
        v[0] = {0, 0};
        normalize();
    }

    Poly(vii &vp) {
        n = vp.size();
        for (int i = 0; i < n; i++) v[i] = vp[i];
        normalize();
    }

    ii &operator[](int i) { return v[i]; }

    bool add(int a, int b) {
        for (int i = 0; i < n; i++) {
            auto [f, s] = v[i];
            if (f == a and s == b) return false;
        }

        v[n++] = ii{a, b};
        normalize();
        return true;
    }

    void normalize() {
        int mx = 100, my = 100;
        for (int i = 0; i < n; i++) {
            auto [f, s] = v[i];
            mx = min(mx, f), my = min(my, s);

```

```

}

id = 0;
for (int i = 0; i < n; i++) {
    auto &[f, s] = v[i];
    f -= mx, s -= my;
    id |= (1LL << (pos[f] + s));
}
}

bool operator<(Poly oth) { return id < oth.id; }
};

vector<Poly> poly[MAXP + 1];

void buildPoly(int mxN) {
    for (int i = 0; i <= mxN; i++) poly[i].clear();

    Poly init;
    queue<Poly> q;
    unordered_set<int64_t> used;
    q.push(init);
    used.insert(init.id);
    while (not q.empty()) {

    return bridges;
}

```

## 5.6 Negative Cycle Bellman Ford

Time:  $O(V \cdot E)$ . Detects whether there is a negative cycle in the graph using Bellman Ford.

```

using edge = tuple<int, int, int>;

bool has_negative_cycle(int s, int N, const vector<edge>& edges) {
    vi dist(N + 1, oo);
    dist[s] = 0;

    for (int i = 1; i <= N - 1; i++)
        for (auto [u, v, w] : edges)
            if (dist[u] < oo and dist[v] > dist[u] + w) dist[v] = dist[u] + w;

    for (auto [u, v, w] : edges)
        if (dist[u] < oo and dist[v] > dist[u] + w) return true;

    return false;
}

```

## 5.7 Negative Cycle Floyd Warshall

Time:  $O(n^3)$ . Detects whether there is a negative cycle in the graph using Floyd Warshall.

```

int dist[MAX][MAX];
vii adj[MAX];

bool has_negative_cycle(int N) {
    for (int u = 1; u <= N; ++u)
        for (int v = 1; v <= N; ++v) dist[u][v] = u == v ? 0 : oo;

    for (int u = 1; u <= N; ++u)
        for (auto [v, w] : adj[u]) dist[u][v] = w;

    for (int k = 1; k <= N; ++k)
        for (int u = 1; u <= N; ++u)
            for (int v = 1; v <= N; ++v)
                if (dist[u][k] < oo and dist[k][v] < oo)
                    dist[u][v] = min(dist[u][v], dist[u][k] + dist[k][v]);

    for (int i = 1; i <= N; ++i)
        if (dist[i][i] < 0) return true;
}

```

```

    return false;
}

```

## 5.8 Dijkstra

```

pair<vl, vl> Graph::dijkstra(ll src) {
    vl pd(this->N, LLONG_MAX), ds(this->N, LLONG_MAX);
    pd[src] = src;
    ds[src] = 0;

    set<pll> st;
    st.emplace(0, src);

```

```

                        dist[u][v] = dist[u][k] + dist[k][v];
                        pred[u][v] = pred[k][v];
                    }
                }
            }
        }

    return {dist, pred};
}

```

## 5.10 Graph

```

class Graph {
private:
    ll N;
    bool undirected;
    vector<vll> adj;

public:
    Graph(ll N, bool is_undirected = true) {
        this->N = N;
        adj.resize(N);
        undirected = is_undirected;
    }

    void add(ll u, ll v, ll w) {
        adj[u].emplace_back(v, w);
        if (undirected) adj[v].emplace_back(u, w);
    }
};

```

## 5.11 TopSort - Kahn

Works only on Directed Acyclic Graphs (DAGs). For each edge (u,v), u comes before v in the ordering. If the task A is a prerequisite for task B, then A comes before B in the ordering. Time:  $O(E \cdot \log(v))$

```

unordered_set<int> in[MAX], out[MAX];

vi topological_sort(int N) {
    vi o;
    queue<int> q;

    for (int u = 1; u <= N; ++u)
        if (in[u].empty()) q.push(u);

    while (not q.empty()) {
        auto u = q.front();
        q.pop();

        o.emplace_back(u);

        for (auto v : out[u]) {
            in[v].erase(u);

            if (in[v].empty()) q.push(v);
        }
    }

    return (int)o.size() == N ? o : vi{};
}

```

```
}
```

## 5.12 Kruskal

Time:  $O(e \cdot \log(v))$

```
using edge = tuple<int, int, int>;

int kruskal(int N, vector<edge>& es) {
    sort(es.begin(), es.end());

    int cost = 0;
    UnionFind udfs(N);

    for (auto [w, u, v] : es) {
        if (not udfs.same_set(u, v)) {
            cost += w;
            udfs.union_set(u, v);
        }
    }

    return cost;
}
```

## 5.13 Minimax

A MST minimizes the maximum weight between the edges in any spanning tree. Time:  $O(e \cdot \log(v))$

```
vii adj[MAX];

int minimax(int u, int N) {
    set<int> C;
    C.insert(u);

    priority_queue<ii, vii, greater<ii>> pq;

    for (auto [v, w] : adj[u]) pq.push(ii(w, v));

    int minmax = -oo;

    while ((int)C.size() < N) {
        int v, w;

        do {
            w = pq.top().first, v = pq.top().second;
            pq.pop();
        } while (C.count(v));

        minmax = max(minmax, w);
        C.insert(v);

        for (auto [s, p] : adj[v]) pq.push(ii(p, s));
    }

    return minmax;
}
```

## 5.14 MSF

Minimum Spanning Forest - a forest of trees of length  $k$  that connects all vertices in a graph with minimum total weight. Time:  $O(e \cdot \log(v))$

```
using edge = tuple<int, int, int>;

int msf(int k, int N, vector<edge>& es) {
    sort(es.begin(), es.end());

    int cost = 0, cc = N;
    UnionFind udfs(N);

    for (auto [w, u, v] : es) {
        if (not udfs.same_set(u, v)) {
            cost += w;
            udfs.union_set(u, v);

            if (--cc == k) return cost;
        }
    }

    return cost;
}
```

## 5.15 Minimum Spanning Graph (MSG)

Given some obligatory edges  $es$ , find a minimum spanning graph that contains them. Time:  $O(e \cdot \log(v))$

```
using edge = tuple<int, int, int>;

const int MAX{100010};

vector<ii> adj[MAX];

int msg(int N, const vector<edge>& es) {
    set<int> C;
    priority_queue<ii, vii, greater<ii>> pq;
    int cost = 0;

    for (auto [u, v, w] : es) {
        cost += w;

        C.insert(u);
        C.insert(v);

        for (auto [r, s] : adj[u]) pq.push(ii(s, r));

        for (auto [r, s] : adj[v]) pq.push(ii(s, r));
    }

    while ((int)C.size() < N) {
        int v, w;

        do {
            w = pq.top().first, v = pq.top().second;
            pq.pop();
        } while (C.count(v));
    }
}
```

```

    cost += w;
    C.insert(v);

    for (auto [s, p] : adj[v]) pq.push(ii(p, s));
}

return cost;
}

```

## 5.16 Prim

A node  $u$  is chosen to start a connected component. Time:  $O(e \cdot \log(v))$

```

const int MAX{100010};

vector<ii> adj[MAX];

int prim(int u, int N) {
    set<int> C;
    C.insert(u);

    priority_queue<ii, vector<ii>, greater<ii>> pq;

    for (auto [v, w] : adj[u]) pq.push(ii(w, v));

    int mst = 0;

    while ((int)C.size() < N) {
        int v, w;

        do {
            w = pq.top().first, v = pq.top().second;
            pq.pop();
        } while (C.count(v));

        mst += w;
        C.insert(v);

        for (auto [s, p] : adj[v]) pq.push(ii(p, s));
    }

    return mst;
}

```

## 5.17 Retrieve Path 2d

```

vll Graph::retrieve_path_2d(ll src, ll trg, const vector<vl>& pred) {
    vll p;

    do {
        p.emplace_back(pred[src][trg], trg);
        trg = pred[src][trg];
    } while (trg != src);

    reverse(all(p));
}

```

```

    return p;
}

```

## 5.18 Retrieve Path

```

vll Graph::retrieve_path(ll src, ll trg, const vl& pred) {
    vll p;

    do {
        p.emplace_back(pred[trg], trg);
        trg = pred[trg];
    } while (trg != src);

    reverse(all(p));

    return p;
}

```

## 5.19 Second Best MST

Time:  $O(v \cdot e)$

```

using edge = tuple<int, int, int>;

pair<int, vi> kruskal(int N, vector<edge>& es, int blocked = -1) {
    vi mst;
    UnionFind udfs(N);
    int cost = 0;

    for (int i = 0; i < (int)es.size(); ++i) {
        auto [w, u, v] = es[i];

        if (i != blocked and not udfs.same_set(u, v)) {
            cost += w;
            udfs.union_set(u, v);
            mst.emplace_back(i);
        }
    }

    return {(int)mst.size() == N - 1 ? cost : oo, mst};
}

int second_best(int N, vector<edge>& es) {
    sort(es.begin(), es.end());

    auto [_, mst] = kruskal(N, es);
    int best = oo;

    for (auto blocked : mst) {
        auto [cost, __] = kruskal(N, es, blocked);
        best = min(best, cost);
    }

    return best;
}

```

## 5.20 TopSort - Tarjan

Works only on Directed Acyclic Graphs (DAGs). For each edge (u,v), u comes before v in the ordering. If the task A is a prerequisite for task B, then A comes before B in the ordering. Time:  $O(V + E)$

```
enum State { NOT_FOUND, FOUND, PROCESSED };

vi adj[MAX];

bool dfs(int u, vi& o, vi& state) {
    if (state[u] == PROCESSED) return true;

    if (state[u] == FOUND) return false;

    state[u] = FOUND;

    for (auto v : adj[u])
        if (not dfs(v, o, state)) return false;

    state[u] = PROCESSED;
    o.emplace_back(u);

    return true;
}

vi topological_sort(int N) {
    vi o, state(N + 1, NOT_FOUND);

    for (int u = 1; u <= N; ++u)
        if (state[u] == NOT_FOUND and not dfs(u, o, state)) return {};

    reverse(o.begin(), o.end());

    return o;
}
```

## 6 Math

### 6.1 Binomial

```
ll binom(ll n, ll k) {
    if (k > n) return 0;
    vll dp(k + 1, 0);
    dp[0] = 1;
    for (ll i = 1; i <= n; i++)
        for (ll j = k; j > 0; j--) dp[j] = dp[j] + dp[j - 1];
    return dp[k];
}
```

### 6.2 Count Divisors Range

```
vl divisors(MAX, 0);
void count_divisors_range() {
    for (ll i = 1; i <= MAX; i++) {
        for (ll j = 1; j * i <= MAX; j++) divisors[i * j]++;
    }
}
```

### 6.3 Count Divisors

```
ll count_divisors(ll num) {
    ll count = 1;
    for (int i = 2; (ll)i * i <= num; i++) {
        if (num % i == 0) {
            int e = 0;
            do {
                e++;
                num /= i;
            } while (num % i == 0);
            count *= e + 1;
        }
    }
    if (num > 1) {
        count *= 2;
    }
    return count;
}
```

### 6.4 Factorization With Sieve

```
map<ll, ll> factorization_with_sieve(ll n, const vl& primes) {
    map<ll, ll> fact;

    for (ll d : primes) {
        if (d * d > n) break;

        ll k = 0;
        while (n % d == 0) {
            k++;
            n /= d;
        }

        if (k) fact[d] = k;
    }

    if (n > 1) fact[n] = 1;
    return fact;
}
```

### 6.5 Factorization

```
map<ll, ll> factorization(ll n) {
    map<ll, ll> ans;
    for (ll i = 2; i * i <= n; i++) {
        ll count = 0;
        for (; n % i == 0; count++, n /= i)
            ;
        if (count) ans[i] = count;
    }
    if (n > 1) ans[n]++;
    return ans;
}
```

### 6.6 Fast Doubling - Fibonacci

The Doubling Method can be seen as an improvement to the matrix exponentiation method to find the N-th Fibonacci number.

Time:  $O(\log N)$ .

```
template <typename T>
class FastDoubling {
public:
    vector<T> sts;
    T a, b, c, d;
    int mod;

    FastDoubling(int mod = 1e9 + 7) : sts(2), mod(mod) {}

    T fib(T x) {
        fill(all(sts), 0);
        a = 0, b = 0, c = 0, d = 0;
        fast_doubling(x, sts);
        return sts[0];
    }

    void fast_doubling(T n, vector<T>& res) {
        if (n == 0) {
            res[0] = 0;
            res[1] = 1;
            return;
        }
        fast_doubling(n >> 1, res);

        a = res[0];
        b = res[1];
        c = (b << 1) - a;

        if (c < 0) c += mod;

        c = (a * c) % mod;
        d = (a * a + b * b) % mod;
        if (n & 1) {
            res[0] = d;
            res[1] = c + d;
        } else {
            res[0] = c;
            res[1] = d;
        }
    }
};
```

## 6.7 Fast Exp Iterative

```
ll fast_exp_it(ll a, ll n, ll mod = LLONG_MAX) {
    a %= mod;
    ll res = 1;

    while (n) {
        if (n & 1) (res *= a) %= mod;

        (a *= a) %= mod;
        n >>= 1;
    }
}
```

```
    return res;
}
```

## 6.8 Fast Exp

```
ll fast_exp(ll a, ll n, ll mod = LLONG_MAX) {
    if (n == 0) return 1;
    if (n == 1) return a;

    ll x = fast_exp(a, n / 2, mod) % mod;

    return ((x * x) % mod * (n & 1 ? a : 1)) % mod;
}
```

## 6.9 Fast Fourier Transform (FFT)

Time:  $O(N \cdot \log N)$

```
using cd = complex<double>;
const double PI = acos(-1);

void fft(vector<cd>& a, bool invert) {
    int n = a.size();

    for (int i = 1, j = 0; i < n; i++) {
        int bit = n >> 1;
        for (; j & bit; bit >>= 1) j ^= bit;
        j ^= bit;

        if (i < j) swap(a[i], a[j]);
    }

    for (int len = 2; len <= n; len <= 1) {
        double ang = 2 * PI / len * (invert ? -1 : 1);
        cd wlen(cos(ang), sin(ang));
        for (int i = 0; i < n; i += len) {
            cd w(1);
            for (int j = 0; j < len / 2; j++) {
                cd u = a[i + j], v = a[i + j + len / 2] * w;
                a[i + j] = u + v;
                a[i + j + len / 2] = u - v;
                w *= wlen;
            }
        }
    }

    if (invert) {
        for (cd& x : a) x /= n;
    }
}

void fft_2d(vector<vector<cd>>& V, bool invert) {
    for (int i = 0; i < V.size(); i++) fft(V[i], invert);
    for (int i = 0; i < V.front().size(); i++) {
        vector<cd> col(V.size());
        for (int k = 0; k < V.size(); k++) col[k] = V[k][i];
        fft(col, invert);
        for (int k = 0; k < V.size(); k++) V[k][i] = col[k];
    }
}
```

```
}
```

## 6.10 GCD

The Euclidean algorithm allows to find the greatest common divisor of two numbers  $a$  and  $b$  in  $O(\log \cdot \min(a, b))$ .

```
11 gcd(11 a, 11 b) { return b ? gcd(b, a % b) : a; }
```

## 6.11 Integer Mod

```
const 11 INF = 1e18;
const 11 mod = 998244353;
template <11 MOD = mod>
```

```
struct Modular {
    11 value;
    static const 11 MOD_value = MOD;
```

```
Modular(11 v = 0) {
    value = v % MOD;
    if (value < 0) value += MOD;
}
Modular(11 a, 11 b) : value(0) {
    *this += a;
    *this /= b;
}
```

```
Modular& operator+=(Modular const& b) {
    value += b.value;
    if (value >= MOD) value -= MOD;
    return *this;
}
```

```
Modular& operator--(Modular const& b) {
    value -= b.value;
    if (value < 0) value += MOD;
    return *this;
}
```

```
Modular& operator*=(Modular const& b) {
    value = (11)value * b.value % MOD;
    return *this;
}
```

```
friend Modular mexp(Modular a, 11 e) {
    Modular res = 1;
    while (e) {
        if (e & 1) res *= a;
        a *= a;
        e >>= 1;
    }
    return res;
}
```

```
friend Modular inverse(Modular a) { return mexp(a, MOD - 2); }
```

```
Modular& operator/=(Modular const& b) { return *this *= inverse(b); }
friend Modular operator+(Modular a, Modular const b) { return a += b; }
```

```
Modular operator++(int) { return this->value = (this->value + 1) % MOD; }
Modular operator++() { return this->value = (this->value + 1) % MOD; }
friend Modular operator-(Modular a, Modular const b) { return a -= b; }
friend Modular operator--(Modular const a) { return 0 - a; }
Modular operator--(int) {
    return this->value = (this->value - 1 + MOD) % MOD;
}
```

```
Modular operator--() { return this->value = (this->value - 1 + MOD) % MOD; }
friend Modular operator*(Modular a, Modular const b) { return a *= b; }
friend Modular operator/(Modular a, Modular const b) { return a /= b; }
friend std::ostream& operator<<(std::ostream& os, Modular const& a) {
    return os << a.value;
}
}
friend bool operator==(Modular const& a, Modular const& b) {
    return a.value == b.value;
}
}
friend bool operator!=(Modular const& a, Modular const& b) {
    return a.value != b.value;
}
}
```

## 6.12 Is prime

$O(\sqrt{N})$

```
bool isprime(11 n) {
    if (n < 2) return false;
    if (n == 2) return true;
    if (n % 2 == 0) return false;
    for (11 i = 3; i * i <= n; i += 2)
        if (n % i == 0) return false;
    return true;
}
```

## 6.13 LCM

Calculating the least common multiple (commonly denoted LCM) can be reduced to calculating the GCD with the following simple formula:  $\text{lcm}(a, b) = (a \cdot b) / \text{gcd}(a, b)$ . Thus, LCM can be calculated using the Euclidean algorithm with the same time complexity:

```
11 lcm(11 a, 11 b) { return a / gcd(a, b) * b; }
```

## 6.14 Euler phi $\varphi(n)$

Computes the number of positive integers less than  $n$  that are co-primes with  $n$ , in  $O(\sqrt{N})$ .

```
11 phi(11 n) {
    if (n == 1) return 1;

    auto fs = factorization(n);
    auto res = n;

    for (auto [p, k] : fs) {
        res /= p;
        res *= (p - 1);
    }
}
```

```

    return res;
}

```

## 6.15 Sieve

```

v1 sieve(ll N) {
    bitset<MAX + 1> sieve;
    v1 ps{2, 3};
    sieve.set();

    for (ll i = 5, step = 2; i <= N; i += step, step = 6 - step) {
        if (sieve[i]) {
            ps.push_back(i);

            for (ll j = i * i; j <= N; j += 2 * i) sieve[j] = false;
        }
    }
    return ps;
}

```

## 6.16 Sum Divisors

```

ll sum_divisors(ll num) {
    ll result = 1;

    for (int i = 2; (ll)i * i <= num; i++) {
        if (num % i == 0) {
            int e = 0;
            do {
                e++;
                num /= i;
            } while (num % i == 0);

}

```

## 8 Strings

### 8.1 Aho-Corasick

The Aho-Corasick algorithm allows us to quickly search for multiple patterns in a text. The set of pattern strings is also called a *dictionary*. We will denote the total length of its constituent strings by  $m$  and the size of the alphabet by  $k$ .

build:  $O(m \cdot k)$

occurrences:  $O(|s| + ans)$

```

const int K = 26;
struct Vertex {
    char pch;
    int next[K];
    bool check = false;
    int p = -1, lnk = -1, out = -1, ps = -1, d = 0;

    Vertex(int p = -1, char ch = '$') : p(p), pch(ch) {
        fill(begin(next), end(next), -1);
    }
};

class AhoCorasick {
public:
    int sz = 0; // number of strings added
    vector<Vertex> t;

    AhoCorasick() : t(1) {}

    void add_string(string const& s) {
        int v = 0, ds = 0;
        for (char ch : s) {
            int c = ch - 'a';
            if (t[v].next[c] == -1) {
                t[v].next[c] = t.size();
                t.emplace_back(v, ch);
            }
            v = t[v].next[c];
            t[v].d = ++ds;
        }
        t[v].check = true;
        t[v].ps = sz++;
    }
}

```

```

void build() {
    queue<int> qs;
    qs.push(0);
    while (qs.size()) {
        auto u = qs.front();
        qs.pop();

        if (!t[u].p or t[u].p == -1)
            t[u].lnk = 0;
        else {
            int k = t[t[u].p].lnk;
            int c = t[u].pch - 'a';
            while (t[k].next[c] == -1 and k) k = t[k].lnk;
            int ts = t[k].next[c];
            if (ts == -1)
                t[u].lnk = 0;
            else
                t[u].lnk = ts;
        }

        if (t[t[u].lnk].check)
            t[u].out = t[u].lnk;
        else
            t[u].out = t[t[u].lnk].out;

        for (auto v : t[u].next)
            if (v != -1) qs.push(v);
    }
}

void occurrences(string const& s, vector<vector<int>>& res) {
    // to just "count" replace 'res' vector with an int
    res.resize(sz);
    for (int i = 0, v = 0; i < s.size(); i++) {
        int c = s[i] - 'a';
        while (t[v].next[c] == -1 and v) v = t[v].lnk;

        int k = v;
        while (t[k].out != -1) {
            k = t[k].out;
            res[t[k].ps].emplace_back(i - t[k].d + 1);
        }
        if (t[v].check) res[t[v].ps].emplace_back(i - t[v].d + 1);
    }
}
};

```

## 8.2 Edit Distance

Returns the minimum number of operations (insert, delete, replace) to transform string  $a$  into string  $b$ .  
Time:  $O(M * N)$

```

int min_value(int x, int y, int z) { return min(min(x, y), z); }

int edit_distance(string str1, string str2) {
    int n = (int)str1.size(), m = (int)str2.size();
    int dp[m + 1][n + 1];

    for (int i = 0; i <= m; i++)
        for (int j = 0; j <= n; j++)
            if (i == 0)
                dp[i][j] = j;
            else if (j == 0)
                dp[i][j] = i;
            else if (str1[i - 1] == str2[j - 1])
                dp[i][j] = dp[i - 1][j - 1];
            else
                dp[i][j] = 1 + min_value(dp[i][j - 1], dp[i - 1][j], dp[i - 1][j - 1]);

    return dp[m][n];
}

```

## 8.3 LCP with Suffix Array

For a given string  $s$  we want to compute the longest common prefix (LCP) of two arbitrary suffixes with position  $i$  and  $j$ . In fact, let the request be to compute the LCP of the suffixes  $p[i]$  and  $p[j]$ . Then the answer to this query will be  $\min(lcp[i], lcp[i + 1], \dots, lcp[j - 1])$ . Thus the problem is reduced to the RMQ. Time:  $O(N)$ .

```

vector<int> lcp_suffix_array(string const& s, vector<int> const& p) {
    int n = s.size();
    vector<int> rank(n, 0);
    for (int i = 0; i < n; i++) rank[p[i]] = i;

    int k = 0;
    vector<int> lcp(n - 1, 0);
    for (int i = 0; i < n; i++) {
        if (rank[i] == n - 1) {
            k = 0;
            continue;
        }
        int j = p[rank[i] + 1];
        while (i + k < n && j + k < n && s[i + k] == s[j + k]) k++;
        lcp[rank[i]] = k;
        if (k) k--;
    }
    return lcp;
}

```

## 8.4 Manacher

Given string  $s$  with length  $n$ . Find all the pairs  $(i, j)$  such that substring  $s[i \dots j]$  is a palindrome. String  $t$  is a palindrome when  $t = t_{rev}$  ( $t_{rev}$  is a reversed string for  $t$ ).  
Time:  $O(N)$

```

vi manacher(string s) {
    string t;
    for (auto c : s) t += string("#") + c;
}

```

```

t = t + '#';

int n = t.size();
t = "$" + t + "~";

vi p(n + 2);
int l = 1, r = 1;
for (int i = 1; i <= n; i++) {
    p[i] = max(0, min(r - i, p[l + (r - i)]));
    while (t[i - p[i]] == t[i + p[i]]) p[i]++;
    if (i + p[i] > r) {
        l = i - p[i], r = i + p[i];
    }
    p[i]--;
}

return vi(begin(p) + 1, end(p) - 1);
}

```

## 8.5 Rabin Karp

```

vector<int> rabin_karp(string const& s, string const& t) {
    const int p = 31;
    const int m = 1e9 + 9;
    int S = s.size(), T = t.size();

    vector<long long> p_pow(max(S, T));
    p_pow[0] = 1;
    for (int i = 1; i < (int)p_pow.size(); i++) p_pow[i] = (p_pow[i - 1] * p) % m;

    vector<long long> h(T + 1, 0);
    for (int i = 0; i < T; i++)
        h[i + 1] = (h[i] + (t[i] - 'a' + 1) * p_pow[i]) % m;
    long long h_s = 0;
    for (int i = 0; i < S; i++) h_s = (h_s + (s[i] - 'a' + 1) * p_pow[i]) % m;

    vector<int> occurrences;
    for (int i = 0; i + S - 1 < T; i++) {
        long long cur_h = (h[i + S] + m - h[i]) % m;
        if (cur_h == h_s * p_pow[i] % m) occurrences.push_back(i);
    }

    return occurrences;
}

```

## 8.7 Suffix Array

Let  $s$  be a string of length  $n$ . The  $i$ -th suffix of  $s$  is the substring  $s[i \dots n - 1]$ .

A suffix array will contain integers that represent the starting indexes of the all the suffixes of a given string, after the aforementioned suffixes are sorted.

Time:  $O(N \log N)$ .

```

vector<int> sort_cyclic_shifts(string const& s) {
    int n = s.size();
    const int alphabet = 128;

    vector<int> p(n), c(n), cnt(max(alphabet, n), 0);
    for (int i = 0; i < n; i++) cnt[s[i]]++;
    for (int i = 1; i < alphabet; i++) cnt[i] += cnt[i - 1];
    for (int i = 0; i < n; i++) p[--cnt[s[i]]] = i;
    c[p[0]] = 0;
    int classes = 1;
    for (int i = 1; i < n; i++) {
        if (s[p[i]] != s[p[i - 1]]) classes++;
        c[p[i]] = classes - 1;
    }
}

```

```

vector<int> pn(n), cn(n);
for (int h = 0; (1 << h) < n; ++h) {
    for (int i = 0; i < n; i++) {
        pn[i] = p[i] - (1 << h);
        if (pn[i] < 0) pn[i] += n;
    }
    fill(cnt.begin(), cnt.begin() + classes, 0);
    for (int i = 0; i < n; i++) cnt[c[pn[i]]]++;
    for (int i = 1; i < classes; i++) cnt[i] += cnt[i - 1];
    for (int i = n - 1; i >= 0; i--) p[--cnt[c[pn[i]]]] = pn[i];
    cn[p[0]] = 0;
    classes = 1;
    for (int i = 1; i < n; i++) {
        pair<int, int> cur = {c[p[i]], c[(p[i] + (1 << h)) % n]};
        pair<int, int> prev = {c[p[i - 1]], c[(p[i - 1] + (1 << h)) % n]};
        if (cur != prev) ++classes;
        cn[p[i]] = classes - 1;
    }
    c.swap(cn);
}

return p;
}

vector<int> suffix_array(string s) {
    s += "$";
    vector<int> p = sort_cyclic_shifts(s);
    p.erase(p.begin());
    return p;
}

```

## 8.8 Suffix Automaton

```

class SuffixAutomaton {
public:
    struct state {
        int len, link;
        array<int, 26> next;
    };

    vector<state> st;
    int sz = 0, last;

    SuffixAutomaton(const string& s) : st(s.size() << 1) {
        sa_init();
        for (auto v : s) sa_extend((int)(v - 'a'));
    }

    void sa_init() {
        st[0].len = 0;
        st[0].link = -1;
        sz++;
        last = 0;
    }

    void sa_extend(int c) {

```

```

int cur = sz++;
st[cur].len = st[last].len + 1;
int p = last;
while (p != -1 && !st[p].next[c]) {
    st[p].next[c] = cur;
    p = st[p].link;
}
if (p == -1)
    st[cur].link = 0;
else {
    int q = st[p].next[c];
    if (st[p].len + 1 == st[q].len)
        st[cur].link = q;
    else {
        int clone = sz++;
        st[clone].len = st[p].len + 1;
        st[clone].link = st[q].link;
        st[clone].next = st[q].next;
        while (p != -1 && st[p].next[c] == q) {
            st[p].next[c] = clone;
            p = st[p].link;
        }
        st[q].link = st[cur].link = clone;
    }
}
last = cur;
}

// longest common substring O(N)
int lcs(const string& T) {
    int v = 0, l = 0, best = 0;
    for (int i = 0; i < T.size(); i++) {
        while (v && !st[v].next[T[i] - 'a']) {
            v = st[v].link;
            l = st[v].len;
        }
        if (st[v].next[T[i] - 'a']) {
            v = st[v].next[T[i] - 'a'];
            l++;
        }
        best = max(best, l);
    }
    return best;
}
};

```

## 8.9 Suffix Tree (CP Algo - freopen)

Build:  $O(N)$

Memory:  $O(N \cdot k)$

$k$  = alphabet length

```

const int aph = 27; // add $ to final of string
const int N = 2e5 + 31;
class SuffixTree {
public:
    string a;
    vector<array<int, aph>> t;
    vector<int> l, r, p, s, dst;

```

```

int tv, tp, ts, la, b;

SuffixTree(const string& str, char bs = 'a') : a(str), t(N), l(N),
    r(N, str.size() - 1), p(N), s(N), dst(N), b(bs) {
    build();
}

void ukkadd(int c) {
    suff++;
    if (r[tv] < tp) {
        if (t[tv][c] == -1) {
            t[tv][c] = ts; l[ts] = la;
            p[ts++] = tv; tv = s[ts]; tp = r[ts] + 1; goto suff;
        }
        tv = t[tv][c]; tp = l[ts];
    }
    if (tp == -1 || c == a[tp] - b) tp++; else {
        l[ts + 1] = la; p[ts + 1] = ts;
        l[ts] = l[ts]; r[ts] = tp - 1; p[ts] = p[ts];
        t[ts][c] = ts + 1; t[ts][a[tp] - b] = tv; l[ts] = tp;
        p[ts] = ts; t[p[ts]][a[l[ts]] - b] = ts; ts += 2;
        tv = s[p[ts] - 2]; tp = l[ts - 2];
        while (tp <= r[ts - 2]) {
            tv = t[ts][a[tp] - b];
            tp += r[ts] - l[ts] + 1;
        }
        if (tp == r[ts - 2] + 1) s[ts - 2] = tv; else s[ts - 2] = ts;
        tp = r[ts] - (tp - r[ts - 2]) + 2; goto suff;
    }
}

void build() {
    ts = 2; tv = 0; tp = 0;
    s[0] = 1; l[0] = -1; r[0] = -1; l[1] = -1; r[1] = -1;
    for (auto& arr : t) { arr.fill(-1); } t[1].fill(0);
    for (la = 0; la < (int)a.size(); ++la) ukkadd(a[la] - b);
}
};

```

## 8.10 Z Function

Suppose we are given a string  $s$  of length  $n$ . The Z-function for this string is an array of length  $n$  where the  $i$ -th element is equal to the greatest number of characters starting from the position  $i$  that coincide with the first characters of  $s$ .

Time:  $O(N)$

```

vector<int> z_function(string s) {
    int n = s.size();
    vector<int> z(n);
    int l = 0, r = 0;
    for (int i = 1; i < n; i++) {
        if (i < r) {
            z[i] = min(r - i, z[i - l]);
        }
        while (i + z[i] < n && s[z[i]] == s[i + z[i]]) {
            z[i]++;
        }
        if (i + z[i] > r) {

```

```

    l = i;
    r = i + z[i];
}
}
return z;
}

```

## 9 Trees

### 9.1 LCA Binary Lifting (CP Algo)

The algorithm described will need  $O(N \cdot \log N)$  for preprocessing the tree, and then  $O(\log N)$  for each LCA query.

```

ll n, l;
vector<ll> adj[MAX];

ll timer;
vector<ll> tin, tout;
vector<vector<ll>> up;

void dfs(ll v, ll p) {
    tin[v] = ++timer;
    up[v][0] = p;
    for (ll i = 1; i <= l; ++i) up[v][i] = up[up[v][i - 1]][i - 1];

    for (ll u : adj[v]) {
        if (u != p) dfs(u, v);
    }

    tout[v] = ++timer;
}

bool is_ancestor(ll u, ll v) { return tin[u] <= tin[v] && tout[u] >= tout[v];
}

ll lca(ll u, ll v) {
    if (is_ancestor(u, v)) return u;
    if (is_ancestor(v, u)) return v;
    for (ll i = l; i >= 0; --i) {
        if (!is_ancestor(up[u][i], v)) u = up[u][i];
    }
    return up[u][0];
}

void preprocess(ll root) {
    tin.resize(n);
    tout.resize(n);
    timer = 0;
    l = ceil(log2(n));
    up.assign(n, vector<ll>(l + 1));
    dfs(root, root);
}

```

### 9.2 LCA SegTree (CP Algo)

The algorithm can answer each query in  $O(\log N)$  with preprocessing in  $O(N)$  time.

```

struct LCA {
    vector<ll> height, euler, first, segtree;
    vector<bool> visited;
    ll n;

    LCA(vector<vector<ll>>& adj, ll root = 0) {
        n = adj.size();
        height.resize(n);
        first.resize(n);
        euler.reserve(n * 2);
        visited.assign(n, false);
        dfs(adj, root);
        ll m = euler.size();
        segtree.resize(m * 4);
        build(1, 0, m - 1);
    }

    void dfs(vector<vector<ll>>& adj, ll node, ll h = 0) {
        visited[node] = true;
        height[node] = h;
        first[node] = euler.size();
        euler.push_back(node);
        for (auto to : adj[node]) {
            if (!visited[to]) {
                dfs(adj, to, h + 1);
                euler.push_back(node);
            }
        }
    }

    void build(ll node, ll b, ll e) {
        if (b == e) {
            segtree[node] = euler[b];
        } else {
            ll mid = (b + e) / 2;
            build(node << 1, b, mid);
            build(node << 1 | 1, mid + 1, e);
            ll l = segtree[node << 1], r = segtree[node << 1 | 1];
            segtree[node] = (height[l] < height[r]) ? l : r;
        }
    }

    ll query(ll node, ll b, ll e, ll L, ll R) {
        if (b > R || e < L) return -1;
        if (b >= L && e <= R) return segtree[node];
        ll mid = (b + e) >> 1;

        ll left = query(node << 1, b, mid, L, R);
        ll right = query(node << 1 | 1, mid + 1, e, L, R);
        if (left == -1) return right;
        if (right == -1) return left;
        return height[left] < height[right] ? left : right;
    }

    ll lca(ll u, ll v) {
        ll left = first[u], right = first[v];
        if (left > right) swap(left, right);
        return query(1, 0, euler.size() - 1, left, right);
    }
}

```

```

}
};

```

### 9.3 LCA Sparse Table

The algorithm described will need  $O(N)$  for preprocessing, and then  $O(1)$  for each LCA query.  
**0 indexed!**

```

typedef vector<vl> vl2d;
#define all(a) a.begin(), a.end()
#define len(x) (int)x.size()

template <typename T>
struct SparseTable {
    vector<T> v;
    ll n;
    static const ll b = 30;
    vl mask, t;

    ll op(ll x, ll y) { return v[x] < v[y] ? x : y; }
    ll msb(ll x) { return __builtin_clz(1) - __builtin_clz(x); }
    SparseTable() {}
    SparseTable(const vector<T>& v_) : v(v_), n(v.size()), mask(n), t(n) {
        for (ll i = 0, at = 0; i < n; mask[i++] = at |= 1) {
            at = (at << 1) & ((1 << b) - 1);
            while (at and op(i, i - msb(at & -at)) == i) at ^= at & -at;
        }
        for (ll i = 0; i < n / b; i++)
            t[i] = b * i + b - 1 - msb(mask[b * i + b - 1]);
        for (ll j = 1; (1 << j) <= n / b; j++)
            for (ll i = 0; i + (1 << j) <= n / b; i++)
                t[n / b * j + i] =
                    op(t[n / b * (j - 1) + i], t[n / b * (j - 1) + i + (1 << (j - 1))]);
    }
    ll small(ll r, ll sz = b) { return r - msb(mask[r] & ((1 << sz) - 1)); }
    T query(ll l, ll r) {
        if (r - l + 1 <= b) return small(r, r - l + 1);
        ll ans = op(small(l + b - 1), small(r));
        ll x = l / b + 1, y = r / b - 1;
        if (x <= y) {
            ll j = msb(y - x + 1);
            ans = op(ans, op(t[n / b * j + x], t[n / b * j + y - (1 << j) + 1]));
        }
        return ans;
    }
};

struct LCA {
    SparseTable<ll> st;
    ll n;
    vl v, pos, dep;

    LCA(const vl2d& g, ll root) : n(len(g)), pos(n) {
        dfs(root, 0, -1, g);
        st = SparseTable<ll>(vector<ll>(all(dep)));
    }

    void dfs(ll i, ll d, ll p, const vl2d& g) {

```

```

        v.emplace_back(len(dep)) = i, pos[i] = len(dep), dep.emplace_back(d);
        for (auto j : g[i])
            if (j != p) {
                dfs(j, d + 1, i, g);
                v.emplace_back(len(dep)) = i, dep.emplace_back(d);
            }
    }

    ll lca(ll a, ll b) {
        ll l = min(pos[a], pos[b]);
        ll r = max(pos[a], pos[b]);
        return v[st.query(l, r)];
    }
    ll dist(ll a, ll b) {
        return dep[pos[a]] + dep[pos[b]] - 2 * dep[pos[lca(a, b)]];
    }
};

```

### 9.4 Tree Flatten

```

vll tree_flatten(ll root) {
    vl pre;
    pre.reserve(N);

    vll flat(N);
    ll timer = -1;
    auto dfs = [&](auto&& self, ll u, ll p) -> void {
        timer++;
        pre.push_back(u);
        for (auto [v, w] : adj[u])
            if (v != p) {
                self(self, v, u);
            }
        flat[u].second = timer;
    };
    dfs(dfs, root, -1);
    for (ll i = 0; i < (ll)N; i++) flat[pre[i]].first = i;
    return flat;
}

```

### 9.5 Tree Isomorph

Checks whether two trees are isomorphic. The function *thash*() returns the hash of the tree (using centroids as special vertices). Two trees are isomorphic if their hash are the same.

```

map<vector<int>, int> mhash;

struct tree {
    int n;
    vector<vector<int>> g;
    vector<int> sz, cs;

    tree(int n_) : n(n_), g(n_), sz(n_) {}

    void dfs_centroid(int v, int p) {
        sz[v] = 1;
        bool cent = true;

```

```

for (int u : g[v])
    if (u != p) {
        dfs_centroid(u, v), sz[v] += sz[u];
        if (sz[u] > n / 2) cent = false;
    }
if (cent and n - sz[v] <= n / 2) cs.push_back(v);
}
int fhash(int v, int p) {
    vector<int> h;
    for (int u : g[v])
        if (u != p) h.push_back(fhash(u, v));
    sort(h.begin(), h.end());
    if (!mphash.count(h)) mphash[h] = mphash.size();
    return mphash[h];
}
ll thash() {
    cs.clear();
    dfs_centroid(0, -1);
    if (cs.size() == 1) return fhash(cs[0], -1);
    ll h1 = fhash(cs[0], cs[1]), h2 = fhash(cs[1], cs[0]);
    return (min(h1, h2) << 30) + max(h1, h2);
}
void add(int a, int b) {
    g[a].emplace_back(b);
    g[b].emplace_back(a);
}
};

```

## 10 Settings and macros

### 10.1 short-macro.cpp

```

#include <bits/stdc++.h>

using namespace std;

#ifdef DEBUG
#include "../settings-and-macros/debug.cpp"
#else
#define dbg(...)
#endif

typedef long long ll;
typedef pair<int, int> ii;

#define all(x) x.begin(), x.end()
#define vin(vt) for (auto &e : vt) cin >> e

auto solve() { }

int main() {
    ios_base::sync_with_stdio(0);
    cin.tie(0);

    ll t = 1;
    //cin >> t;
}

```

```

while (t--) solve();

return 0;
}

```

### 10.2 macro.cpp

```

#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>

using namespace __gnu_pbds;
#define ordered_set tree<int, null_type, less<int>, rb_tree_tag,
    tree_order_statistics_node_update>

using namespace std;

#ifdef DEBUG
#include "../settings-and-macros/debug.cpp"
#else
#define dbg(...)
#endif

typedef long long ll;
typedef pair<int, int> pii;
typedef pair<ll, ll> pll;
typedef vector<int> vi;
typedef vector<ll> vl;
typedef vector<pii> vii;
typedef vector<pll> vll;

#define fst first
#define snd second
#define all(x) x.begin(), x.end()
#define len(vt) (int)vt.size()
#define vin(vt) for (auto &e : vt) cin >> e
#define LSOne(S) ((S) & -(S))
#define MSOne(S) (1ull << (63 - __builtin_clzll(S)))
#define fastio ios_base::sync_with_stdio(0); \
    cin.tie(0); \
    cout.tie(0)

const vii dir4 {{1,0},{-1,0},{0,1},{0,-1}};

auto solve() { }

int main() {
    fastio;

    ll t = 1;
    //cin >> t;

    while (t--) solve();

    return 0;
}

```

# 11 Theoretical guide

## 11.1 Notable Series

1. Sum of the first  $n$  naturals:

$$S_n = \sum_{i=1}^n i = 1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

2. Sum of the squares of the first  $n$  naturals:

$$S_n = \sum_{i=1}^n i^2 = 1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

3. Sum of the cubes of the first natural  $n$ :

$$S_n = \sum_{i=1}^n i^3 = 1^3 + 2^3 + 3^3 + \dots + n^3 = \left[ \frac{n(n+1)}{2} \right]^2$$

4. Sum of the first  $n$  odd numbers:

$$S_n = \sum_{i=1}^n 2i - 1 = 1 + 3 + 5 + \dots + (2n - 1) = n^2$$

## 11.2 Number of Different Substrings

$$\sum_{i=0}^{n-1} (n - p[i]) - \sum_{i=0}^{n-2} \text{lcp}[i] = \frac{n^2 + n}{2} - \sum_{i=0}^{n-2} \text{lcp}[i]$$

## 11.3 Exponent With Module

If  $a$  and  $m$  are coprime, then

$$a^n \equiv a^{n \bmod \phi(m)} \bmod m$$

Generally, if  $n \geq \log_2 m$ , then

$$a^n \equiv a^{\phi(m) + [n \bmod \phi(m)]} \bmod m$$

## 11.4 String Matching with FFT

We are given two strings, a text  $T$  and a pattern  $P$ , consisting of lowercase letters. We have to compute all the occurrences of the pattern in the text.

We create a polynomial for each string ( $T[i]$  and  $P[i]$  are numbers between 0 and 25 corresponding to the 26 letters of the alphabet):

$$A(x) = a_0x^0 + a_1x^1 + \dots + a_{n-1}x^{n-1}, \quad n = |T|$$

with

$$a_i = \cos(\alpha_i) + i \sin(\alpha_i), \quad \alpha_i = \frac{2\pi T[i]}{26}$$

And

$$B(x) = b_0x^0 + b_1x^1 + \dots + b_{m-1}x^{m-1}, \quad m = |P|$$

with

$$b_i = \cos(\beta_i) - i \sin(\beta_i), \quad \beta_i = \frac{2\pi P[m - i - 1]}{26}$$

Notice that with the expression  $P[m - i - 1]$  explicitly reverses the pattern.

The  $(m - 1 + i)$ th coefficients of the product of the two polynomials  $C(x) = A(x) \cdot B(x)$  will tell us, if the pattern appears in the text at position  $i$ .

If there isn't a match, then at least a character is different, which leads that one of the products  $a_{i+1} \cdot b_{m-1-i}$  is not equal to 1, which leads to the coefficient  $c_{m-1+i} \neq m$ .

### 11.4.1 Wildcards

This is an extension of the previous problem. This time we allow that the pattern contains the wildcard character  $*$ , which can match every possible letter.

We create the exact same polynomials, except that we set  $b_i = 0$  if  $P[m - i - 1] = *$ . If  $x$  is the number of wildcards in  $P$ , then we will have a match of  $P$  in  $T$  at index  $i$  if  $c_{m-1+i} = m - x$ .

## 11.5 Modular Multiplicative Inverse

A modular multiplicative inverse of an integer  $a$  is an integer  $x$  such that  $a \cdot x$  is congruent to 1 modular some modulus  $m$ . To write it in a formal way:

$$a \cdot x \equiv 1 \bmod m.$$

Euler's theorem, which states that the following congruence is true if  $a$  and  $m$  are co-primes:

$$a^{\phi(m)} \equiv 1 \bmod m$$

Multiply both sides of the above equations by  $a^{-1}$ , and we get:

- For an arbitrary (but coprime) modulus  $m$ :  $a^{\phi(m)-1} \equiv a^{-1} \bmod m$
- For a prime modulus  $m$ :  $a^{m-2} \equiv a^{-1} \bmod m$

From these results, we can easily find the modular inverse using the binary exponentiation algorithm, which works in  $O(\log m)$  time.
